

Use-Case Flow

Use Case: UC-01 – Ingest Audit Logs

Primary Actor: Enterprise Application

Preconditions:

The audit log is available in JSON format and the system is ready to receive it

Main Success Scenario:

1. Enterprise Application sends a JSON audit log to the system.
2. The system checks the JSON format.
3. The system finds PII such as Social Security Numbers and credit card numbers.
4. The system masks the PII.
5. The system creates a SHA-256 hash for the audit log.
6. The system saves the protected audit log.

Alternate Flow : Invalid JSON Format

1. The system finds that the audit log is not in the required JSON format.
2. The system rejects the audit log.
3. The system shows an error message to the Enterprise Application.

Postconditions:

1. The valid audit log is stored with PII hidden.
2. A SHA-256 hash is saved with the audit log.
3. If the JSON format is invalid, the audit log is not stored.
